

Scientists develop a decision support system for clinicians. QS WOWNEWS

Researchers of Peter the Great St. Petersburg Polytechnic University (SPbPU), in collaboration with the Almazov National Medical Research Centre, developed an artificial intelligence system for analyzing endoscopic images (mucous membranes of organs). Such an approach is required for conducting mass screening studies, as well as for examining patients in remote settlements in conditions of lack of hi-tech medical equipment. The joint work results were published in one of the top-rated medical journals, the International Journal of Gynecologic Cancer.
