Scientists Predict Economically Important Traits of Crops. SEEDWORLD

Researchers from Peter the Great St.Petersburg Polytechnic University (SPbPU) developed a new mathematical model to predict economic performance of crops. It can assist the breeders to obtain the plants with the highest possible quality. The research results were presented at the fifth "Plant genetics, genomics, bioinformatics, and biotechnology" (PlantGen2019) conference as well as published in BMC Genetics and supported by the Russian Foundation for Basic Research, project 18-29-13033.
